NovaVue 4.0 Release Information

Nova Power Cloud Solutions (NPCS) is proud to report the full General Availability (GA) release of NovaVue 4.0. This 4.0 release is available for both our web portal and iOS App.

NovaVue 4.0 continues our long-term commitment to continuous improvement of our advanced IIoT platform. We have added several features which enhance our client's ability to collect, protect, and analyze their critical infrastructure data.

What's New:

- Introduction of "Composite Devices" which are a collection of 2 or more real devices. For example, if you have separate voltage and current meters for the same load, you could combine them into a single device in NovaVue.
- Addition of new reports into the system:
 - Consumption/generation reports (kWh) (device level)
 - Inventory report (Building level)
 - Alarm Reports (device level)
- NovaVue Billing Module added as an option to the Reporting System
- Ability to one-click download alarm and wave form capture history list
- Improvements to classification and description of wave form captures
- Ability to move any device to the top of a building hierarchy by using the "favorite" function
- Support for new devices and device types
- Add ability for user to manually enter in meter reading data

Bug Fixes and Improvements:

- Improved Agent performance
- Improvements and additions to our REST API
- Added enhanced logging capabilities

Coming Soon:

- Additional reports / visualizations
